

SW4P Earn

Execution Plan, Technical Requirements Document, and Statement of Work

Version v0.1 | Prepared for RNDRNTWRK / \$555 / SW4P | 2026-05-06

North Star: route real 555 volume through approved pools, reward real liquidity, compound Pump/SW4P/product revenue into depth, and prove every number publicly.

1. Executive Thesis

SW4P Earn is a cross-chain staking and liquidity system where \$555 holders and liquidity providers earn from real trading activity, while SW4P, Pump creator fees, product revenue bags, and future market-maker infrastructure compound into deeper liquidity and better execution.

The product must separate real-fee yield from incentives and utility boosts. LPs earn pool fees because their capital supports pools. Global 555 lockers earn boosts, rebates, governance rights, and selected protocol rewards by explicit policy.

2. Non-Negotiable Rules

Rule	Execution meaning
No fake volume	Rewards exclude wash loops, owned-wallet churn, MM internal rebalancing, and suspicious self-volume.
No unbacked EVM supply	EVM \$555 supply must be backed by Solana locked supply through NTT accounting.
No hidden fee stack	SW4P fee, DEX fee, bridge cost, slippage, and fallback behavior are visible before execution.
No misleading APY	Dashboard splits real-fee APY, incentive APY, and utility boosts.
Base first	Do not fragment liquidity before Base proves route quality, TVL, and fee yield.
Public proof first	Dashboard must show volume, TVL, fees, rewards, NTT supply, Pump fees, buybacks, reserves, and exclusions.

3. 100M Token Program Allocation

Bucket	Allocation	Purpose
Base liquidity capacity	40,000,000 555	Primary EVM pool and first routing target
Arbitrum liquidity capacity	20,000,000 555	Secondary DeFi-native expansion
Polygon liquidity/campaign capacity	10,000,000 555	Consumer, creator, and payment experiments
LP incentives reserve	12,000,000 555	Released only against real TVL and real routed volume
Market-maker inventory reserve	10,000,000 555	Future callable/contracted inventory, not gifted
Bridge/emergency reserve	5,000,000 555	NTT/rate-limit recovery, failed transfer recovery, ops buffer
Partner integrations	3,000,000 555	Strategic apps, wallets, marketplaces, creator campaigns

4. FDV and Liquidity Math

555 price	FDV	100M value	USDC/ETH needed	Total 50/50 TVL
\$0.0001000	\$100.0K	\$10.0K	\$10.0K	\$20.0K
\$0.0010000	\$1.00M	\$100.0K	\$100.0K	\$200.0K
\$0.0050000	\$5.00M	\$500.0K	\$500.0K	\$1.00M
\$0.0100000	\$10.00M	\$1.00M	\$1.00M	\$2.00M
\$0.1000000	\$100.00M	\$10.00M	\$10.00M	\$20.00M
\$1.0000000	\$1.00B	\$100.00M	\$100.00M	\$200.00M
\$5.0000000	\$5.00B	\$500.00M	\$500.00M	\$1.00B

Interpretation: the same 100M tokens become much more powerful as the token reprices. At low FDV, the constraint is paired USDC/ETH liquidity, not token count.

5. Money-Maker Model

Source	Planning rate	Primary use
DEX LP fees	0.30% of routed pool volume	LP/staker yield and vault economics
SW4P protocol fee	50 bps of routed SW4P volume	ARP, staker share, platform allocation, buybacks/reserves/treasury
Pump creator fees	Conservative 0.30% of Pump/Solana 555 volume	POL, buyback/burn, LP incentives, MM fund, reserve
Product revenue bags	Variable by product	Paired liquidity, buybacks, reserves, MM readiness

Pump Fee Accelerator Allocation

Pump daily volume	Creator fee/day	POL	Buyback/burn	LP incentives	MM fund	Ops/reserve
\$10.0K	\$30.00	\$13.50	\$6.00	\$4.50	\$3.00	\$3.00
\$100.0K	\$300.00	\$135.00	\$60.00	\$45.00	\$30.00	\$30.00
\$1.00M	\$3.0K	\$1.4K	\$600.00	\$450.00	\$300.00	\$300.00
\$10.00M	\$30.0K	\$13.5K	\$6.0K	\$4.5K	\$3.0K	\$3.0K

6. Real Yield Model

Assumption: DEX 0.30% fee with 80% to LP/stakers plus SW4P 0.50% fee with 45% to pool stakeholders. Combined LP/staker capture is 46.5 bps of routed volume.

Pool TVL	Daily routed volume	Rewards/day	Rewards/year	Fee APR
\$50.0K	\$10.0K	\$46.50	\$17.0K	33.9%
\$50.0K	\$25.0K	\$116.25	\$42.4K	84.9%
\$50.0K	\$100.0K	\$465.00	\$169.7K	339.4%
\$250.0K	\$10.0K	\$46.50	\$17.0K	6.8%
\$250.0K	\$25.0K	\$116.25	\$42.4K	17.0%
\$250.0K	\$100.0K	\$465.00	\$169.7K	67.9%
\$250.0K	\$250.0K	\$1.2K	\$424.3K	169.7%
\$250.0K	\$1.00M	\$4.7K	\$1.70M	678.9%
\$1.00M	\$10.0K	\$46.50	\$17.0K	1.7%
\$1.00M	\$25.0K	\$116.25	\$42.4K	4.2%
\$1.00M	\$100.0K	\$465.00	\$169.7K	17.0%
\$1.00M	\$250.0K	\$1.2K	\$424.3K	42.4%
\$1.00M	\$1.00M	\$4.7K	\$1.70M	169.7%

High early APR is acceptable only if generated by real volume. High APR should attract more TVL, which improves execution and normalizes yield.

7. Lock Timelines

Lock term	Multiplier	Purpose
Flexible, 7-day cooldown	0.5x	Casual holders
30 days	1.0x	Base staking
90 days	1.75x	Serious holders
180 days	2.5x	Long-term liquidity supporters
365 days	4.0x	Strategic holders and governance participants

8. Execution Plan

Phase	Goal	Core deliverables	Acceptance gate
0 Foundation	Remove ambiguity before cross-chain supply	Decimal verification, NTT policy, allocation registry, fee policy, dashboard wireframe	Token metadata verified; no unresolved P0 ambiguity

1 Base Genesis	Make Base first EVM home	Base ERC-20, NTT manager, Base pool, GlobalStakeVault, LPVault, POL vault	NTT transfer both directions; small swaps pass guardrails
2 SW4P Routing	Route real volume safely	Route scoring, pool caps, route event ledger, slippage guardrails	SW4P routes only when best-execution passes
3 Fee/Rewards	Make real fees claimable	DEX harvester, SW4P fee allocation, Pump fee ingest, reward epochs	Rewards trace to fee events and cannot double-claim
4 Liquidity Bootstrap	Grow paired liquidity	LP incentives, USDC/ETH LP onboarding, Matched 555 beta	Incentives conditioned on real TVL and route volume
5 Expansion	Add chains after proof	Arbitrum, then Polygon; gauge controls	Base thresholds met before expansion
6 MM Readiness	Prepare market-quality support	MM vault, quote-depth reports, callable inventory	No-wash mandate and public reporting in place

Part B — Technical Requirements Document

TRD Objective

Build the technical system that lets SW4P route real \$555 flow through approved pools, lets users stake or provide liquidity, distributes fees transparently, and uses Pump/SW4P/product revenue to compound liquidity, buybacks, reserves, and market-maker readiness.

Functional Requirements

ID	Requirement	Priority
FR-001	Verify live \$555 token metadata and decimals at startup and deployment	P0
FR-002	Deploy Base ERC-20 \$555 and NTT manager with 1:1 supply backing	P0
FR-003	Maintain cross-chain supply ledger: Solana locked, EVM minted, EVM burned, Solana unlocked	P0
FR-004	Create PoolRegistry for approved pools, caps, fee tiers, chain, status, route limits	P0
FR-005	Implement SW4P route scoring with best-execution and slippage guardrails	P0
FR-006	Implement Global 555 Lock with lock multipliers and cooldowns	P0
FR-007	Implement LP Vault for two-sided 555 + USDC/ETH liquidity	P0
FR-008	Implement Protocol-Owned Liquidity Vault	P0
FR-009	Implement fee harvester for DEX LP fees and SW4P fee events	P0
FR-010	Implement Pump creator fee ingest/accounting bucket	P0
FR-011	Implement RewardsDistributor with real-fee and incentive APY separation	P0
FR-012	Implement public proof dashboard	P0
FR-013	Implement Matched 555 Vault	P1
FR-014	Implement Arbitrum pool/vault after Base criteria	P1
FR-015	Implement market-maker vault and reporting	P2

Components

Component	Layer	Purpose
EVM555Token	Base contract	ERC-20 \$555, mint/burn restricted to NTT Manager
NttManager	Cross-chain	NTT supply movement and rate limits
PoolRegistry	Contract/API	Approved pools, route caps, fee tiers, statuses
GlobalStakeVault	Contract	555 locks, multipliers, cooldowns
LPVault	Contract	Two-sided LP deposits and share accounting
ProtocolOwnedLiquidityVault	Contract	Protocol-owned LP positions
RewardsDistributor	Contract/service	Epoch rewards and claims
SW4P Quote Engine	Backend	Route selection and best-execution

		enforcement
Fee Event Ledger	Backend/data	DEX, SW4P, Pump, product revenue source accounting
Dashboard API	Backend	Public metrics and proof layer
Risk/Antiwash Engine	Backend	Exclude fake/suspicious reward volume

Route Guardrails

Guardrail	Initial value
Max extra cost versus best route	25-50 bps
Max pool price impact	1.0% early, tighter as TVL grows
Max trade size at Level 1 pool	\$250 equivalent
Reward exclusion	Treasury, self-volume, MM internal rebalance, suspicious loops
Pool health check	TVL, depth, stale price, fee harvest status, route success rate

Pool Level Ladder

Level	TVL	SW4P routing behavior
Level 0	<\$10K	No default routing; small manual/bootstrap only
Level 1	\$10K-\$50K	Route small trades only
Level 2	\$50K-\$250K	Route 25%-50% of eligible flow
Level 3	\$250K-\$1M	Route majority if best-execution passes
Level 4	\$1M+	Primary route if execution quality is best or comparable

Security Requirements

Requirement	Why
Chain-verify token decimals	Avoid failed or mis-sized NTT/burn operations
NTT rate limits by chain	Prevent drain/abuse and control deployment pace
Multisig treasury/reserve controls	Reduce hot-wallet and insider risk
Pausable vaults/router	Emergency response for exploit or market event
Anti-wash reward exclusions	Protect rewards and public metrics integrity
Immutable reward epochs	Prevent retroactive reward manipulation
Proof hashes and public dashboard	Make economics auditable

Part C — Statement of Work

SOW Purpose

This SOW defines the work required to deliver SW4P Earn Phase 1: Base NTT deployment, Base 555/USDC pool integration, staking and LP vaults, SW4P real-volume routing, fee and reward accounting, Pump fee integration, dashboard proof, and liquidity bootstrap mechanisms.

Scope

In scope	Out of scope for Phase 1
Token metadata/decimal verification	CEX listings
Base NTT and ERC-20 deployment	Market-maker execution agreement
Base 555/USDC pool and PoolRegistry	Arbitrum/Polygon production launch
Global Lock, LP Vault, POL Vault	Guaranteed APY or token-price outcomes
SW4P routing guardrails and event ledger	Fully autonomous treasury without multisig review
Fee/reward engine and Pump fee accounting	Fake volume, wash trading, undisclosed MM activity
Public proof dashboard and launch runbooks	

Milestones and Acceptance Criteria

Milestone	Deliverables	Acceptance criteria
M0 Design freeze	TRD, SOW, fee policy, route policy, reward policy	Stakeholder signoff and no unresolved P0 ambiguity

M1 Token/NTT readiness	Decimal verification, NTT config, cross-chain supply policy	Test transfer and supply invariant pass
M2 Base contracts	ERC-20, NTT Manager, PoolRegistry, vault contracts	Test suite and testnet deployment pass
M3 SW4P routing	Quote engine, route caps, ledger, best-execution guardrails	Small trades route only when guardrails pass
M4 Rewards engine	Fee ingest, reward epochs, claims, APY calculation	Rewards trace to fee events and no double claims
M5 Dashboard	Public supply, TVL, fees, rewards, Pump fees, POL	Dashboard reconciles with chain/indexer data
M6 Base beta launch	Base pool, LP onboarding, staking, limited SW4P routing	Low-value canaries pass and monitoring live
M7 Liquidity bootstrap	Incentive campaigns, matched-liquidity beta	TVL and route thresholds tracked publicly

Risk Register

Risk	Severity	Mitigation
Decimal mismatch causes transfer/burn errors	Critical	Chain-verify decimals and fail closed
Low USDC liquidity limits routing	High	Pool ladder, external LP incentives, fee-funded POL
Rewards attract farmed/wash volume	High	Anti-wash filters, classifications, reward exclusions
Liquidity fragmentation	High	Base first, add chains only after thresholds
Fee stack hurts users	Medium	Best-execution threshold and transparent quotes
Pump fees fluctuate	Medium	Treat Pump as accelerator, not guaranteed yield
Market maker creates reputational risk	Medium	No-wash mandate, public reports, inventory limits
Treasury hot-wallet risk	High	Multisig, caps, sweep rules, approval gates
Dashboard inconsistency	High	Reconciliation jobs and proof hashes

Launch Checklist

- ☐ Token decimals verified on Solana
- ☐ All hardcoded decimals removed or chain-verified
- ☐ Base ERC-20 verified on explorer
- ☐ NTT Base route tested both directions
- ☐ PoolRegistry live
- ☐ Base 555/USDC pool live
- ☐ GlobalStakeVault live
- ☐ LPVault live
- ☐ POL vault live
- ☐ SW4P route guardrails live
- ☐ Fee event ledger live
- ☐ Pump fee ingest/accounting live
- ☐ Dashboard live
- ☐ APY source separation live
- ☐ Anti-wash filters live

- ☐ Pause/runbook tested
- ☐ Low-value canaries pass
- ☐ Public launch note published

Final Expert Recommendation

Ship Base-only SW4P Earn first. Do not spread the 100M program across several EVM chains immediately. The first public milestone should be: Base 555 is live, backed by NTT, with a transparent 555/USDC pool, SW4P routing, staking, LP rewards, Pump fee accounting, and a public proof dashboard.

Once Base proves real routed volume, grow the system by increasing Base route caps, adding external USDC LP campaigns, enabling Matched 555 Vault, expanding to Arbitrum, expanding to Polygon, and adding a market-maker mandate only after liquidity and volume justify it.

Appendix — Reference Facts Used

Reference area	Use in this plan
Wormhole NTT	Cross-chain native token topology, hub-and-spoke supply model, rate-limit/accounting concepts
Uniswap fee tiers	LPs earn fees from pools they support; 0.30% is a common volatile-pair tier
Pump fee docs	Creator fees exist on bonding curve/PumpSwap and can be modeled as liquidity accelerator
RNDRNTWRK economics	ARP, creator/platform, and 20/5/5/70 platform allocation
SW4P fee model	50 bps protocol fee assumption
